<u>Aims:</u>

a) Synthesise an understanding of the conceptual aspects and appreciate the complex nature of the inter relationships that exist between occupant comfort, energy flows in buildings and energy efficient building design.

- b) Apply the above in practice and define how they relate to adaptation and sustainability in the built environment.
- c) Develop a systematic, holistic, multidisciplinary and analytical approach to the critical appraisal of energy efficient design, heat flows, and provision of thermal comfort with respect to the demands of climate change adaptation and the principles of sustainability.

Learning Outcomes:

At the end of this module, students will be able to:

- 1. Demonstrate a comprehensive understanding of the principles of occupant comfort in the context of energy efficient design of the built environment under an adaptation and sustainability remit;
- 2. Illustrate a critical understanding of the general principles of heat transfers and ventilation in buildings in the context of the design of buildings under an adaptation and sustainability remit;
- 3. Demonstrate skills in numerical analysis applied to energy flows in buildings;
- 4. Critically evaluate a building's design in terms of effectiveness in providing for occupant comfort, energy efficiency, wider environmental impacts, and resilience to climate change;

Learning Activities:

This module will comprise a series of lectures covering factual material, alongside interactive seminars, practical workshop, presentations, and tutorials. Throughout this process an active exchange of views and opinions is encouraged.

Distance learners will have access to the lectures via the VLE and will take part in group seminars to discuss the lecture topics via Skype. The practical activities will be available as situation related practical exercises

Outline Syllabus:

Thermal comfort, Heat transfers through building fabric, determination of U values; Thermal mass, Ventilation, Impact of moisture on building fabric and occupant health, Passive Cooling, Passive approaches to sunlight and solar gain, Natural lighting, Solar resource, Urban heat island effect, Climate influences on design and future climate change considerations for this and Quantification of building performance

Assessment Details:

1. Coursework: Essay (2,000 word max). 67%

2. Coursework: Numerical Analysis 1000 words equivalent). 33%

Weighting between E and CW: 0% 100%

Relationship between learning outcomes and assessment tasks:

| Learning Outcomes | | | | | | | |
|-------------------|---|---|---|---|--|--|--|
| | 1 | 2 | 3 | 4 | | | |
| Component 1 | Х | Х | | | | | |
| Component 2 | | | Х | Х | | | |
| | | | | | | | |

Minimum Pass Mark (%): 50

Module Notes:

This module is available to be studied on-site or at distance
